

Program for exercise # 8 (21-11-2001)

Write a program that will read names and student numbers of students and print **your** student number (you should enter also yourself).

Example for student John:

“Enter 5 students and their student numbers.”

“Name:” Peter

”Student number:” 10

“Name:” John

“Student number:” 23

“Name:” Carl

“Student number:” 12

“Name:” John

“Student number:” 22

“Name:” Eva

“Student number:” 11

“I am John and your student number is 23 or 22!”

To compare your name with one given, use function `strcmp` from `#include<string.h>` header file (man `strcmp` will give you more detail about function). You should define how many students shell your program read ahead.

Note: Giving only first name, you can have several students with name like yours. Print student number of all of them (see example).
